

```
/*
TASK 4: Analyze a UI and decompose it into reusable React components
-----
```

```
UI CHOSEN: A simple "Product Dashboard" page containing:
```

- A Header (logo + title)
- A Search bar
- A grid of Product Cards (image, name, price, Add to Cart button)
- A Footer

```
COMPONENT HIERARCHY (top to bottom):
```

```
WHY EACH IS ITS OWN COMPONENT (reusability reasoning):
```

- Header: appears once, but separated because it's a distinct visual/logical section.
- SearchBar: could be reused on other pages (e.g., search products, search orders).
- ProductList: manages the array of products and loops through them.
- ProductCard: REUSABLE same component renders for every single product, just with different props (name, price, image).
- Button: REUSABLE a generic button component so "Add to Cart", "Buy Now", "Submit" etc. all share consistent styling/behavior instead of repeating code.

```
This file is plain JSX-style code to illustrate the structure/hierarchy for
your assignment. It is written as separate components with props, exactly
how you would organize files in a real React project (each component would
normally live in its own file like Header.jsx, ProductCard.jsx, etc.)
```

```
*/
```

```
/* ----- 1. Button (reusable, generic) ----- */
function Button({ label, onClick, color = "■#2563eb" }) {
  return (
    <button
      onClick={onClick}
      style={{
        background: color,
        color: "white",
        border: "none",
        padding: "8px 14px",
        borderRadius: "6px",
        cursor: "pointer",
      }}
    >
      {label}
    </button>
  );
}
```

Reusable across the tree: Button and ProductCard
